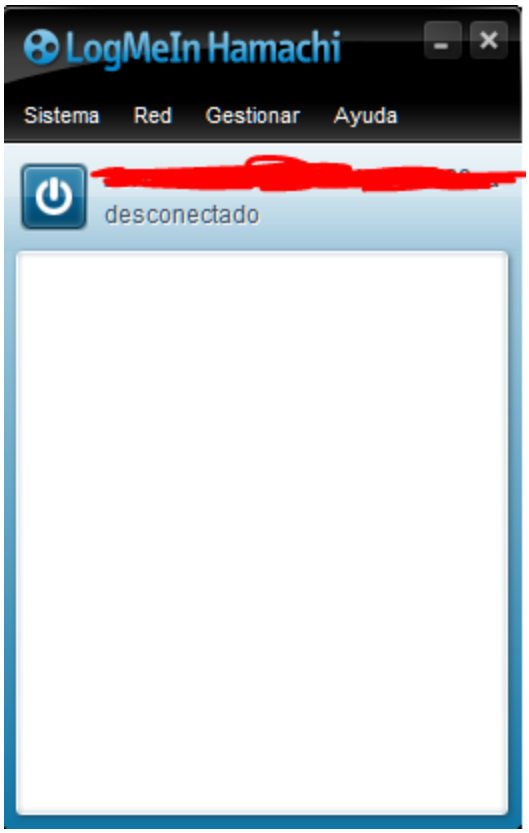
How to use Pizza Tower Versus with Hamachi

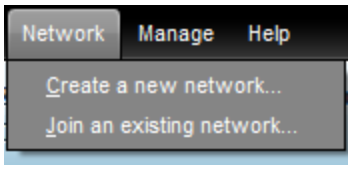
Requirements:

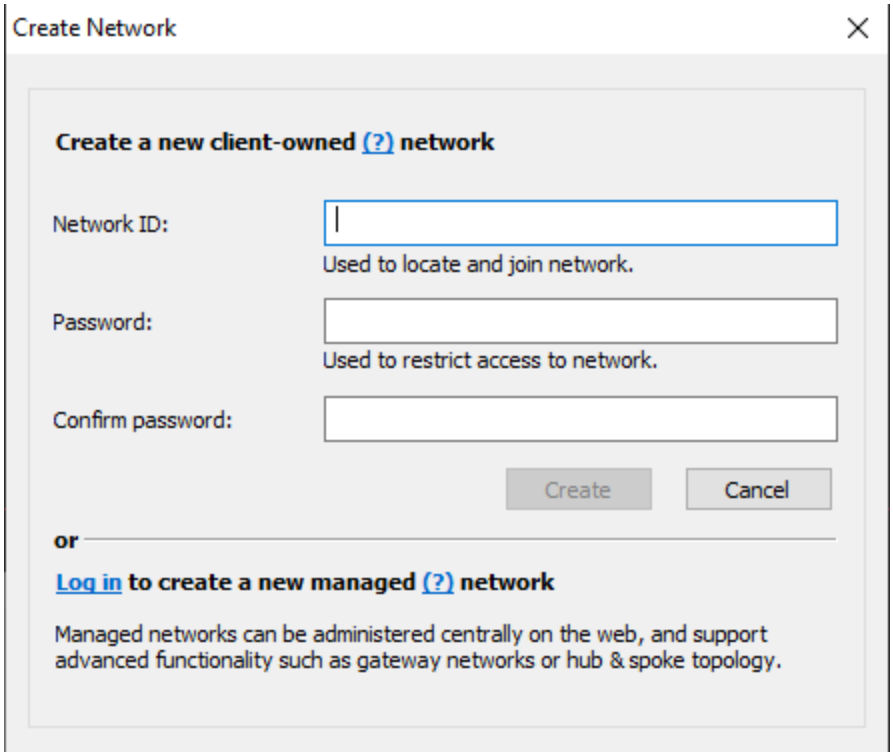
- Pizza Tower VS build, of course.
- Hamachi, get it from here: https://www.vpn.net/. All peers should have hamachi.

Once you have hamachi installed, and an account created (if it asks you to create an account of course) hit the big power button



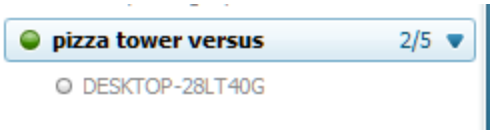
Once you're in go to Network -> Create a new network.



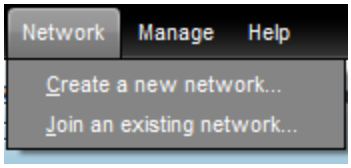


Create Network
Create a new client-owned (?) network
Network ID:
Used to locate and join network.
Password:
Used to restrict access to network.
Confirm password:
Create
Cancel
or
Log in to create a new managed (?) network
Managed networks can be administered centrally on the web, and support advanced functionality such as gateway networks or hub & spoke topology.

And fill in the blanks, Network ID is just a name to give to your network, and hit Create.
Now you have a network.

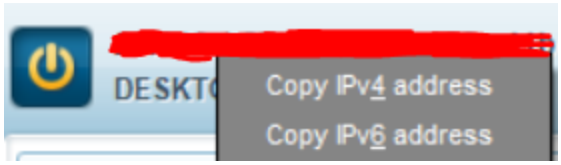


Ask your friends to join your network with the name and password of your network in Network -> Join an existing network.



Once your friends are in your network, create a server using the application in the Host folder of Pizza Tower Versus.

Set your port, and send your friends your IP which you can find by right clicking the numbers at the side of the power button in Hamachi, the IPv4 one.



And they just type your IPv4 in the client and you're set to go.
